NO, Yucca Mountain is not suitable for the nation's nuclear waste dump.

There is not enough information about the future safety of such a site..... what about caverns that might exist within these mountains? Can it be made impregnable to terrorist attacks? What about leakage?

Basically, we are guessing about a deposit of "hot" material that will impinge on our land for at least 10,000 years.

Also, why are we not exploring alternate forms of energy?

Wind mill farms? Use of sunlight? (What more feasible than a source of energy that will be in existence for at least 6 billion more years. After that, who cares?)

There are other, admittedly polluting, forms of energy - but we might have to make a choice..... nuclear energy is OK until we deal with the matter of radiation disposal.

Let's not create a "hot" planet for our descendants.

Sincerely,

Renee M. O'Brien
